

Azure Project 1

Scenario

According to recent research, 40-75% of employees are using Dropbox to share files inside and outside of their businesses. Half of those Dropbox users do this even though they know it's against the rules. More than 40% of businesses have experienced the exposure of confidential information and the estimated average cost of a data breach equaled \$5.5 Million in 2011.

These files, containing sensitive company and customer data, are stored in a public cloud outside of the businesses' control - possibly even outside of the country. The potential for data leakage and security breaches is enormous and companies need to stay compliant with their own policies and procedures for security and governance

Architecture diagram

Architecture Implementation	
1	Implement 2 different subnets (one public and the other private) in a virtual network
2	Install and configure MySQL on an Ubuntu 18.04 virtual machine on the private subnet using the instructions provided. (Hint: Use a bastion host and a NAT gateway)
3	Install and configure OwnCloud on an Ubuntu 18.04 virtual machine on the public subnet using the provided instructions.
4	Configure the network security groups to allow the required ports
5	Test the installation by accessing the IP of the application server in a browser

Step 1: VPC and Subnet Creation

Step number	a
Step name	Creation of Virtual Network
Instructions	<p>1) Create a new resource group. You need to use this resource group to deploy all the resources in this exercise</p> <ol style="list-style-type: none"> Search for resource groups using the search bar at the top of the screen Click on Create Enter a name and region of your choice. Remember to use the same region for all deployments in this exercise. Click on Review +Create and create the resource group <p>2) Navigate to Virtual Networks and click on Create</p> <ol style="list-style-type: none"> Name : P1VNET IPv4 CIDR Block : 10.0.0.0/16 Delete the default created subnet and add the following subnets <ol style="list-style-type: none"> Public subnet with CIDR 10.0.1.0/24 Private subnet with CIDR 10.0.2.0/24 The rest of the options can be set to the default values Click on Create to create the virtual network
Expected screenshots	<ol style="list-style-type: none"> Created virtual network with properties visible Properties of public subnet Properties of private subnet

<Insert Screenshot a(1) here>

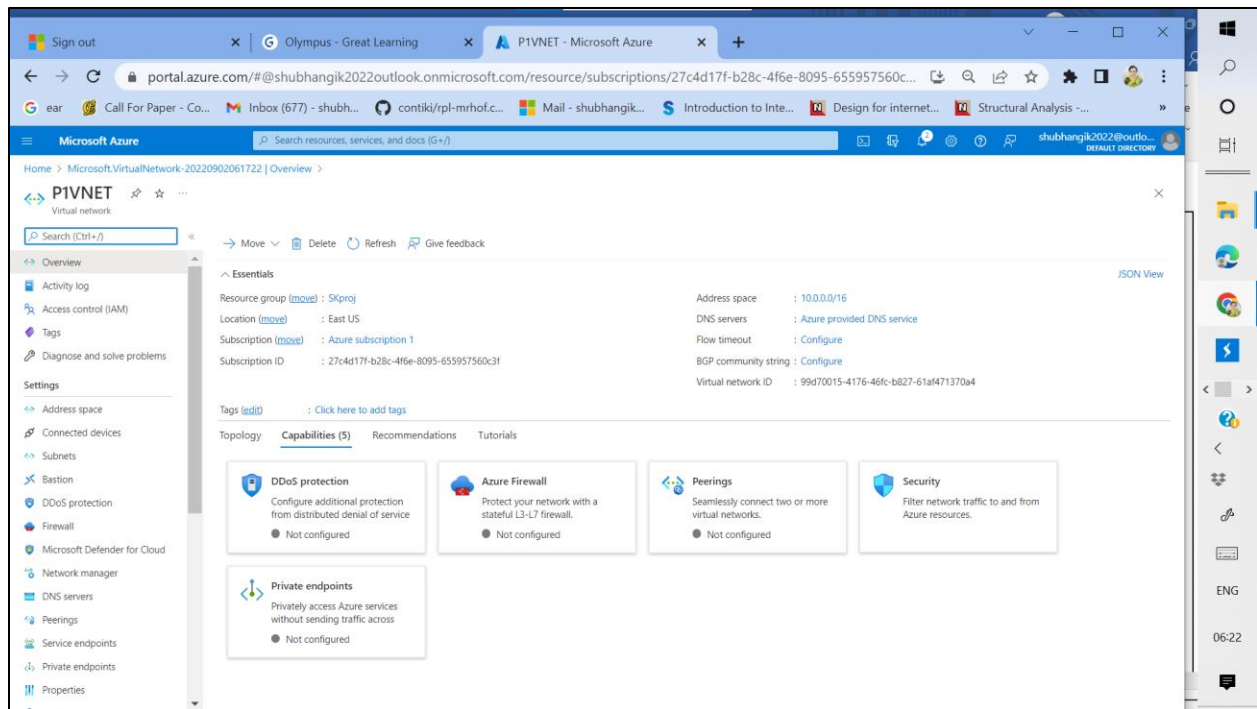

Figure 1: Created virtual network with properties visible

<Insert Screenshot a(2) here>

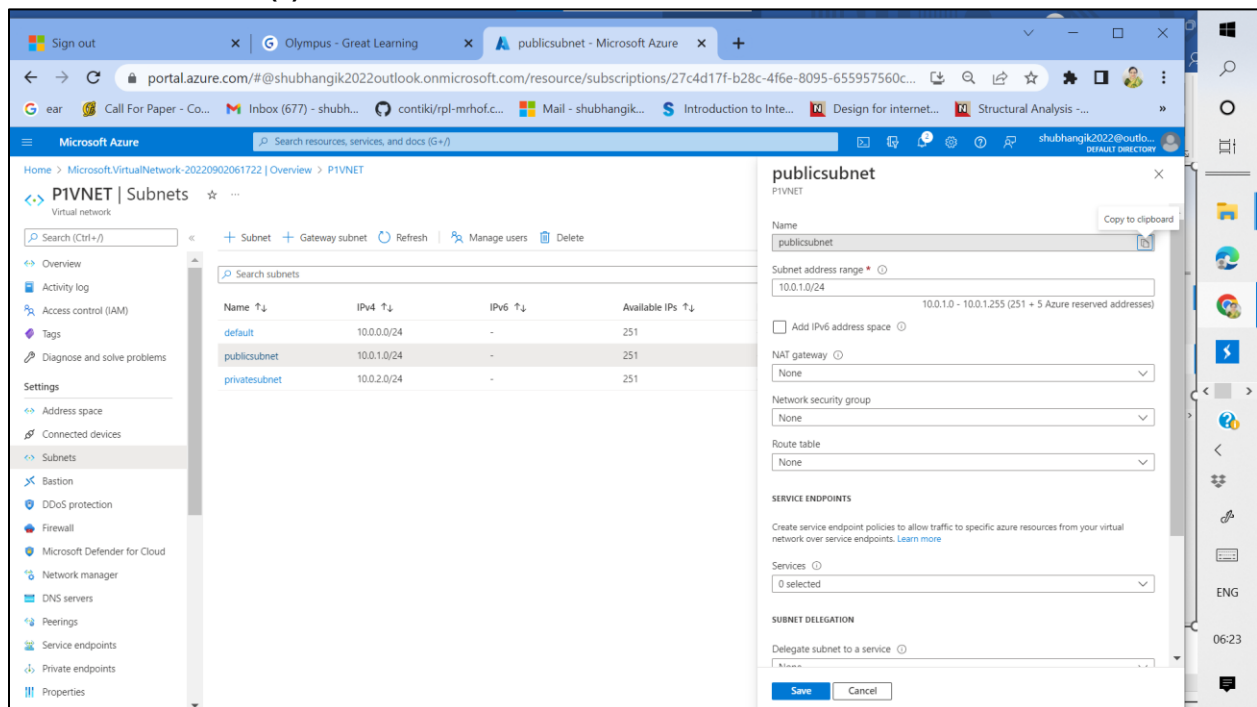

Figure 2: Properties of public subnet

<Insert Screenshot a(3) here>

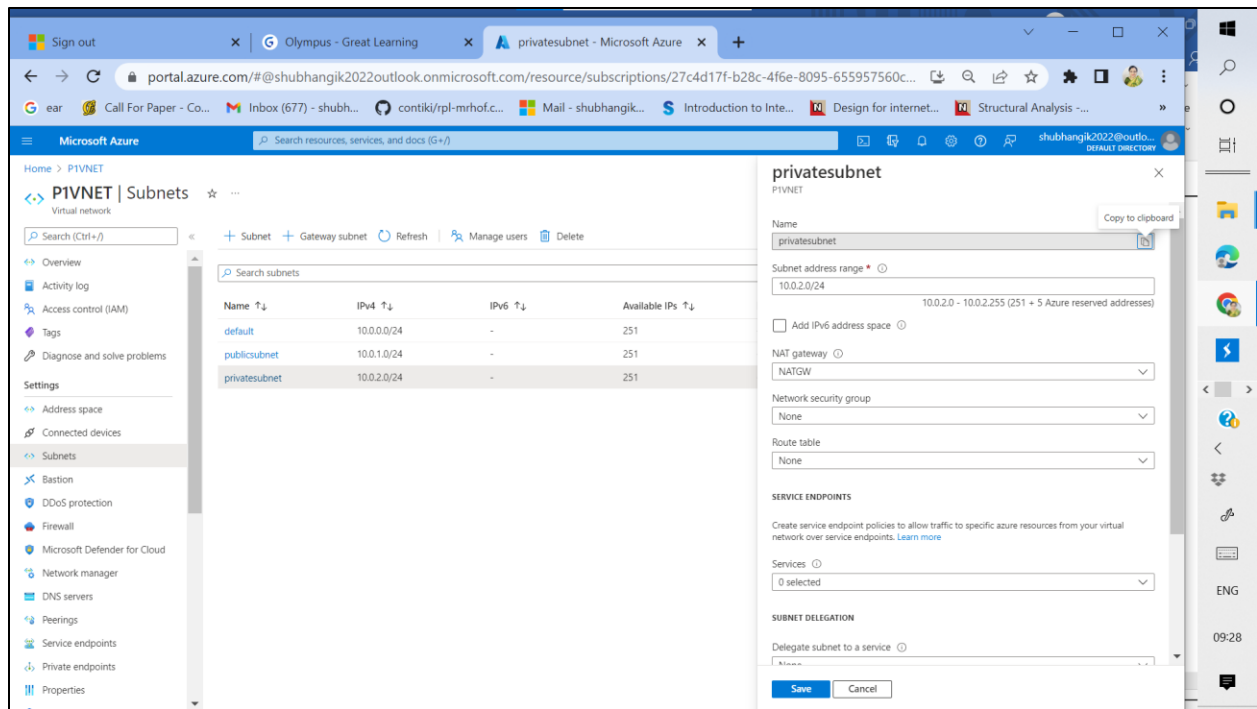

Figure 3: Properties of private subnet

Step number	b
Step name	Creation of NAT Gateway
Instructions	<ol style="list-style-type: none"> 1) Navigate to NAT Gateways 2) Click on "Create" <ol style="list-style-type: none"> a) Use the resource group created above and the same region it is deployed in b) Use a new public IP and public IP prefix for the NAT gateway. Ensure that the public IP prefix has a CIDR size of /30 → /30 is not accepted in azure free trial subscription. So used pay as U go service c) When asked to select the subnet, select the private subnet created above d) Click on Create 3) Navigate to virtual network and select the network created above 4) Select the private subnet created under Subnets in the menu on the left of the screen. 5) Under NAT Gateway, select the gateway created just now and select Save.
Expected screenshots	1) Created NAT gateway

<Insert Screenshot b(1) here>

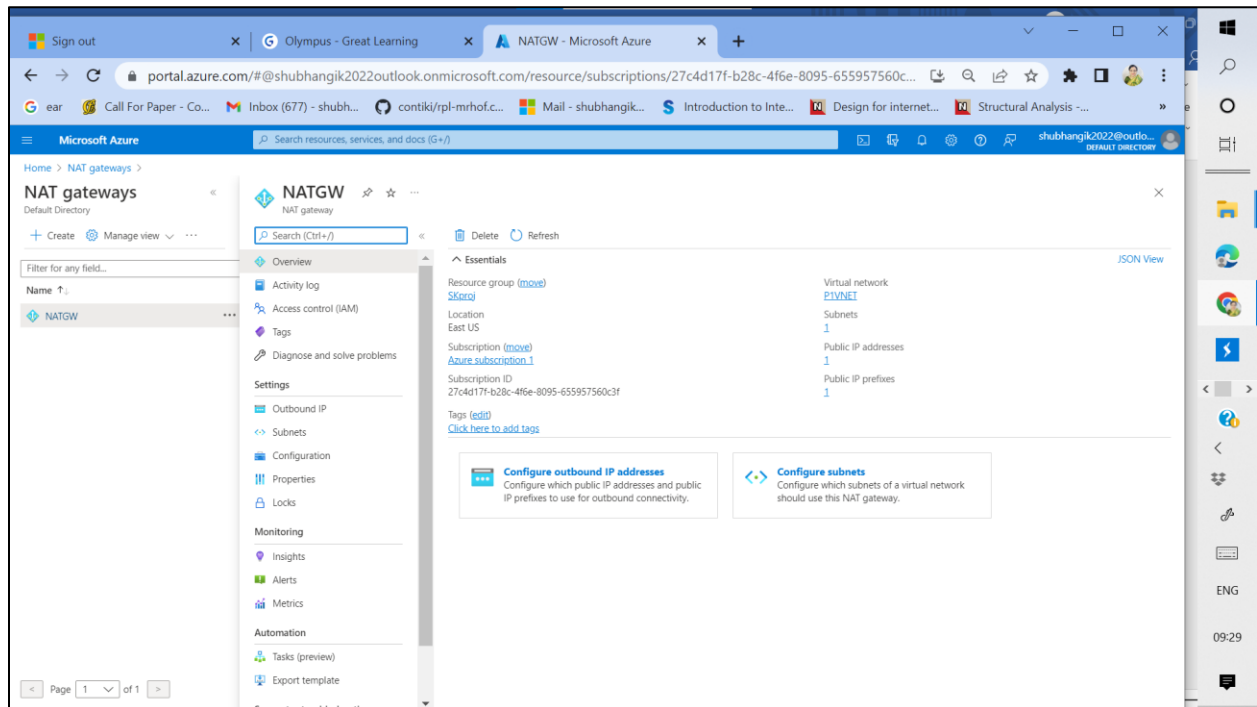

Figure 4: Created NAT Gateway

Step number	c
Step name	Creation and configuration of Network security groups
Instructions	<ol style="list-style-type: none"> 1) Navigate to Network Security Groups 2) Click on Create <ol style="list-style-type: none"> a) Resource Group: Use the one previously created b) Enter the name: AppNSG c) Region: Same as the resource group 4) Click on Create 5) Create another security group with the name DbNSG 6) Navigate to the security group AppNSG 7) Add inbound rules for ports 22 and 80 for any sources and destinations 8) Navigate to the security group DbNSG 9) Add inbound rules for ports 3306 and 22 for any sources and destinations
Expected screenshots	<ol style="list-style-type: none"> 1) AppNSG security rules 2) DbNSG security rules

<Insert Screenshot c(1) here>

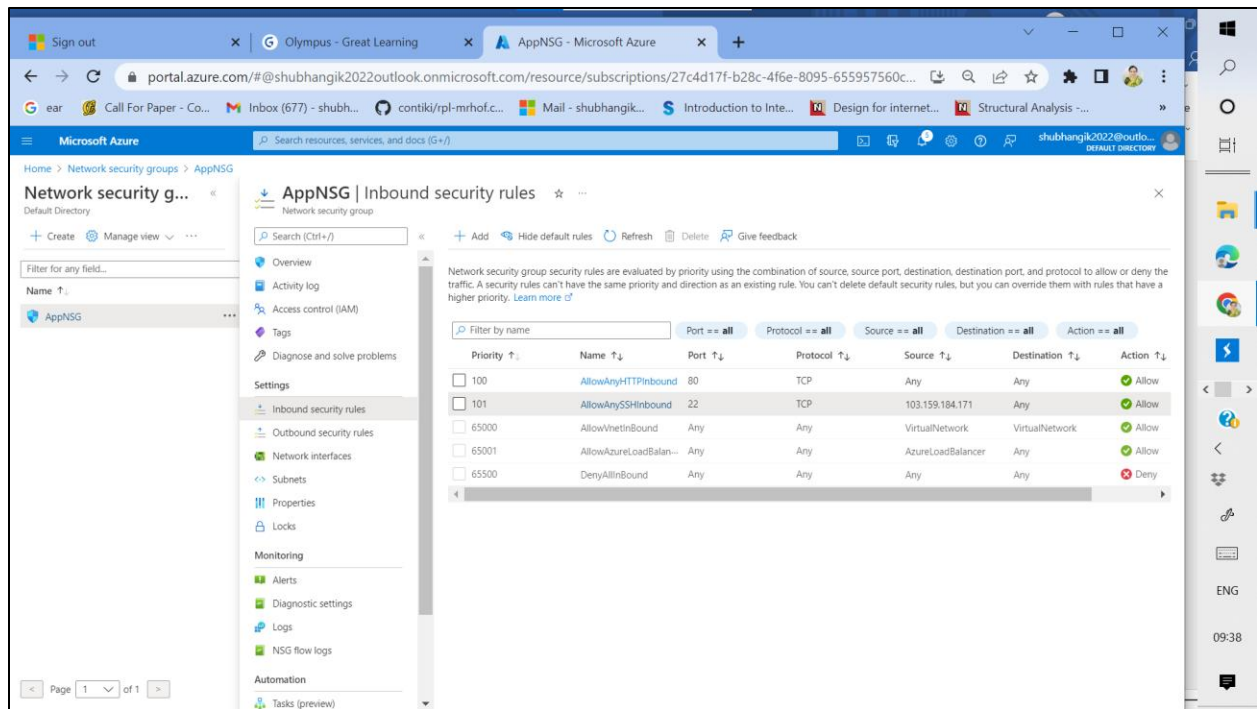

Figure 5: AppNSG security rules

<Insert Screenshot c(2) here>

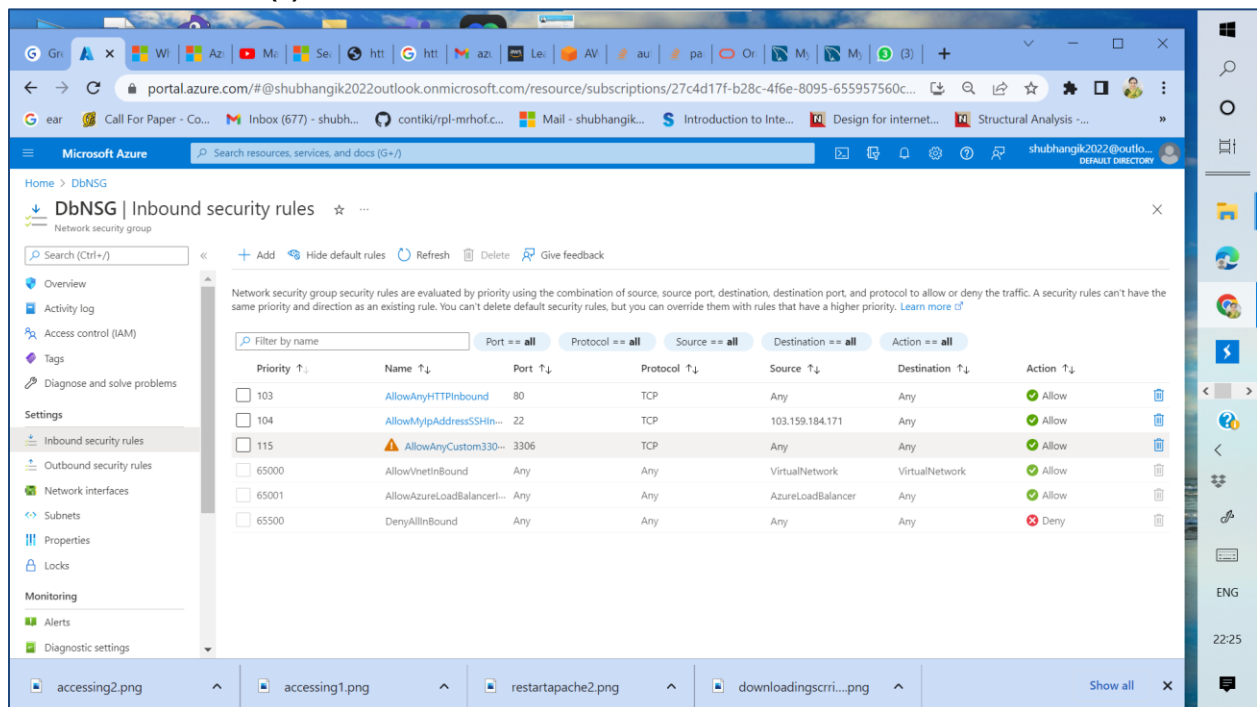

Figure 6: DbNSG security rules

Step 2 : Instance Creation

Step number	a
Step name	Creation of Application server
Instructions	<ol style="list-style-type: none">1) Navigate to Virtual machines2) Click on "Create"3) Create a virtual machine with the following properties<ol style="list-style-type: none">a) Resource Group: As Created aboveb) Region: Same as used beforec) Image: Ubuntu 18.04 LTSd) Authentication type: SSH public keye) Username: ubuntuf) Create a new key pairg) Inbound rules: Allow 22 and 80h) Virtual Network : P1VNETi) Subnet : Public subnet create abovej) Create a new public IPk) Network security group: Select Advanced and then pick AppNSG from the dropdownl) The rest of the options can be set to their default Values
Expected screenshots	1) Created Application server Overview page

<Insert Screenshot a(1) here >

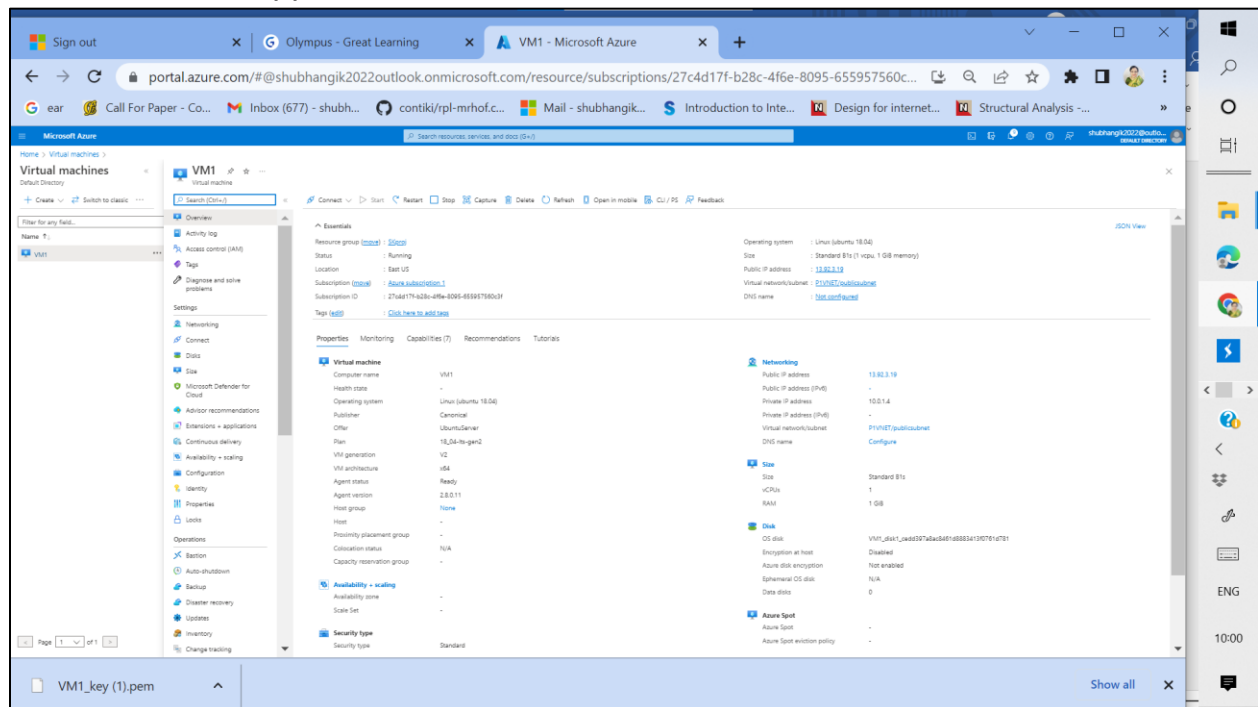

Figure 7: Created Application server Overview page

Step number	b
Step name	Creation of Database server
Instructions	<p>1) Create a virtual machine with the following properties</p> <ol style="list-style-type: none"> Resource Group: As Created above Region: Same as used before Image : Ubuntu 18.04 LTS Authentication type: SSH public key Username: ubuntu Create a new key pair (or reuse the one created for the application server) Inbound rules: Allow 22 and 80 Virtual Network : P1VNET Subnet : Private subnet create above No public IP is required here Network security group: Select Advanced and then pick DbNSG from the dropdown The rest of the options can be set to their default Values
Expected screenshots	1) Created Database server overview page

<Insert Screenshot 2(b) here>

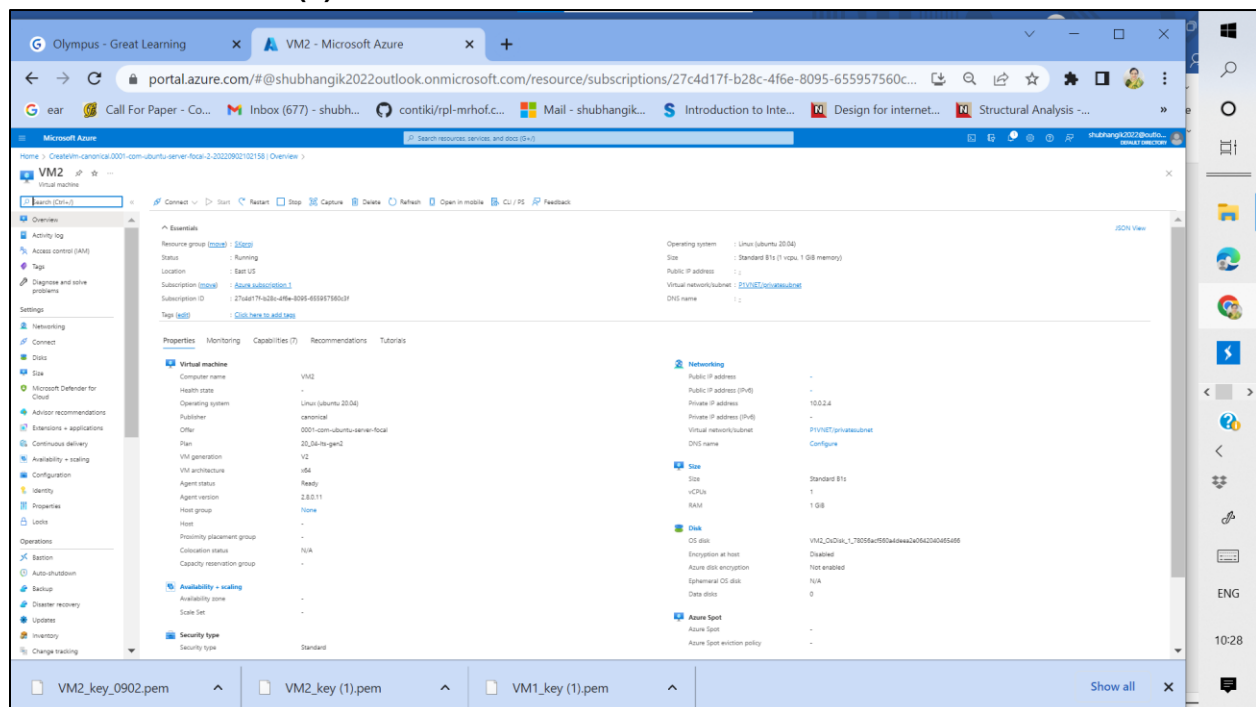

Figure 8: Created Database server overview page

Step 4: Application and Database Installation and Testing

Step number	a
Step name	Installation and configuration of MySQL
Instructions	<p>1) Copy the database pem file into the application server using the below command <i>scp -i <application server pem file> <database server pem file> ubuntu@<application server public IP>:/home/ubuntu</i></p> <p>2) Log into the application server using your SSH client of choice</p> <p>3) From the application server, log into the database server using the pem file copied in step 1 and the private IP address of the database server with the following command <i>ssh -i <database server pem file> ubuntu@<private IP of database server></i></p> <p>4) Enter the following commands to install and configure MySQL on the database server <i>sudo apt update</i> <i>sudo apt install dos2unix -y</i> <i>wget https://d6opu47qoi4ee.cloudfront.net/azure_install_mysql.sh</i> <i>sudo chmod 700 azure_install_mysql.sh</i> <i>sudo dos2unix azure_install_mysql.sh</i> <i>sudo ./azure_install_mysql.sh</i></p> <p>5) Type <i>exit</i> to exit the database server and go back to the application server</p>
Expected screenshots	<p>1) Downloading of the provided script</p> <p>2) Executing the script</p>

Step 5: Answer the following questions

1) Which of the following resources is optional at the time of VM creation?

- a) **Public IP address**
- b) Virtual Network
- c) Network Interface
- d) Resource Group

Answer 1 a) Public IP address

2) Network Security group rules are evaluated in order of _____.

- a) **Priority**
- b) Name (Alphabetical)
- c) Direction
- d) Port number

Answer 2 a) Priority

- 3) Which of the following properties may change depending on the size of the VM?
- a) **All of these**
 - b) Max number of disks
 - c) Memory
 - d) vCPUs

Answer 3 a) All of these

- 4) Which of the following qualifies as a destination for inbound NSG rules?
- a) **NIC**
 - b) Virtual Network
 - c) Resource Group
 - d) Virtual machine

Answer 4 a) NIC

- 5) Which of the following is not true about local VNET Peering?
- a) It is transitive
 - b) It is commutative
 - c) The 2 networks need to be in the same region
 - d) **All of these**

Answer 5d) All of these

- 6) Which of the following would qualify as a point-to-site VPN connection?
- a) **Local machine to VPN gateway**
 - b) VM to VM within the same virtual network
 - c) VM to VM within the different virtual network
 - d) VM to MySQL deployment within the same virtual network

Answer 6 a) Local machine to VPN gateway

- 7) Which of the following is not a property of an incoming load balancer request?
- a) Source IP
 - b) Protocol
 - c) Destination port
 - d) **Name of virtual network**

Answer 7d) Name of virtual network
